

Nesting of methods

Nesting of methods in Java means **calling one method inside another method** of the same class. It helps reduce code repetition and makes the program more structured.

Definition:

When a method of a class **calls another method of the same class**, it is called **nesting of methods**.

```
class Nesting {  
    int square(int n) {  
        return n * n;  
    }  
  
    void display() {  
        int result = square(5); // method calling another method  
        System.out.println("Square = " + result);  
    }  
  
    public static void main(String[] args) {  
        Nesting obj = new Nesting(); // object created  
        obj.display();           // method called by object  
    }  
}
```
